

Insights

(30th Jan 2020 to 04th June 2021)

- Percentage of Recovered cases across India seems to be around 90%, few states even have above 95%. But states like Sikkim, Mizoram, Nagaland have only around 75% cases recovered. None of the eastern states have above 90% recovered cases.
- Percentage of Active cases is less in central and west India -under 5%. Other states have around 10% except the states Sikkim, Mizoram, Nagaland which has above 20% active cases as of 04th June 2021.
- Percentage of deceased cases is around 1% to 1.3% for most of the states, Punjab has the highest percentage of deceased cases- 2.5%.
- With active to recovered ratio we see west and central India is doing better. Again Sikkim, Mizoram, Nagaland are doing worst.

Government and other healthcare agencies should look in and help Sikkim, Mizoram, Nagaland to treat covid cases and improve their recovery rate.

- If we take a look at the state vs date dashboard in the states story, we see for Punjab the deceased percentage is on a slightly increasing curve and it is the same for few other states.
- But as for India is taken over all things are getting better as of 4th June 2021, the active % dropping and recovered % is peaking.

As far vaccination is concerned Maharashtra leads in total dose administered and total individuals administered. But only 15% of Maharashtra is vaccinated. There are many states like Tamil Nadu, Bihar, Uttar Pradesh, Jharkhand with under 10% of the population vaccinated.

The Government should check whether the vaccines are distributed to states population wise, if that is already done, government should keep promoting and encouraging people who are eligible to get vaccinated.

The fight is not over, take precautions, be careful and stay safe
